# Novel Patch Designs & Technologies (Skinning the Cat Without Reinventing the Wheel)

Ken Miller ISYN Consulting

## **American Slang**

"There is more than one way to skin a cat."

There is more than one way to solve a problem.

"Reinventing the wheel"

Don't develop a new solution to a problem that's already been solved.

# What You're In For

- Novel patch designs and acknowledgement of elegant engineering solutions
- Insight into the commonality of challenges and how solutions transcend industries

## History

- The first commercial transdermal patch was Transderm Scop developed by Alza and approved by the FDA on New Year's Eve 1979.
- Alza dominated patch development for the next 20 years with Transderm Nitro, Catapres-TTS, Estraderm, Durogesic, Nicoderm and Testoderm.

# **Overcoming Challenges**

- Slowing delivery
- Controlling delivery
- Preventing crystallization
- Preventing cold flow
- Preventing oxidation

## Challenge #1: Slowing diffusion

 The "rate-controlling" membrane

 Alza (Transderm Scop, Catapres-TTS, Estraderm, Testoderm, Duragesic)

#### US Pat 3,996,934: A Zaffaroni (December 14, 1976)

- Filed August 9, 1971
- Claim 1: A medical bandage...wherein one or more...rate controlling membranes are laminated to the surface of the reservoir....

# Where Else Have We Seen This?

#### • Tyvek

# Where Else Have We Seen This?

#### • Air Freshener

# Where Else Have We Seen This?

#### Salt Shaker

# Challenge #2: Steady diffusion

- Fick's 1<sup>st</sup> law says diffusion from a simple, sub-saturated reservoir is first-order (rate is proportional to thermodynamic activity)

Time

• In other words, if you deliver 10% of the drug, the rate falls by 10%

# Challenge #2: Steady diffusion

- Conversely, if you want to keep the rate from changing by more than 10%, you can only deliver 10% of the drug in the reservoir.
- The obvious way to avoid this limitation is not to use a simple, sub-saturated reservoir.
- To keep rate constant, thermodynamic activity must be constant

#### US Pat 4,314,557: S Chandrasakaran (February 9, 1982)

- Filed May 19, 1980
- Claim 1: An active agent dispenser consisting essentially of ... a particulate active agent solute phase dispersed in a continuous matrix phase....

## US Pat 4,314,557: S Chandrasakaran

Solid Flat Body
 Drug Particles
 Matrix

### US Pat 4,314,557: S Chandrasakaran

 When solid drug particles dissolve into the matrix faster than dissolved drug diffuses through skin, the matrix remains saturated until all drug particles dissolve. (Activity is constant.)

#### Lollipop

#### Toilet Bowl Cleaner

# Challenge #3: Crystallization

- Occurs in a super-saturated solution after a **nucleation event**.
- Continues until the solution is no longer supersaturated.
- It's very difficult to tell when a visco-elastic adhesive solution is super-saturated ...until it crystallizes

# **Preventing Crystallization**

- Two ways to prevent crystallization
  - Avoid super-saturation by reducing concentration or increasing solubility
    - (stable, but decreases delivery rate)
  - Avoid nucleation
    - (rapid delivery rate, but meta-stable)

## **Crystal Nucleation**

- High-energy interfaces increase the likelihood of nucleation.
  - Backing/Adhesive
  - Membrane / Adhesive
  - Release liner/Adhesive
  - Edges (Air/Adhesive)

## **Transderm Scop**

- Crystals of scopolamine began to occur at the membrane surface.
- Nucleation sites likely created during lamination phase of production.

#### US Pat 6,238,700: J Dohner et al., (May 29, 2001)

- Filed May 5, 1998
- Claim 1: An improved method for manufacturing ... comprising... heating... each individual film or laminate... immediately following formation....
- Creates a meta-stable film *resistant* to spontaneous crystallization

(but, it's still super-saturated)

### Metallurgy

#### Chocolate

### What If Heating Once Isn't Enough?

©ISYN Consulting

#### US Pat 8,840,921: I Jasch (September 23, 2014)

- Filed December 22, 2009
- Invention description: ...the release liner film and/or the carrier layer are...put through a pair of heatable opposing rollers.... One of both rollers can serve to create peripheral separating edges, particularly to separate individual patches from the layers.
- Individual patches are cut out using heated dies.

Cutting polystyrene

Heat-sealed packaging

Surgery

# Challenge #3: Cold Flow

• A visco-elastic pressure-sensitive adhesive must flow, but...

- Excessive flow during storage can
  - foul the packaging,
  - foul the release liner
  - reduce potency.

# **Proven Solutions for Cold Flow**

- Minor
  - Release liner inserts (e.g., Mylan FTS)

Baking

# **Proven Solutions for Cold Flow**

Moderate to severe
 Dimples (e.g., Exelon)

# **Proven Solutions for Cold Flow**

Moderate to severe

 Blister package (Patented by Nitto Denko in 2012
 [8,146,741])

# Challenge #4: Oxidation

- Oxidation of susceptible APIs can occur through
  - Exposure to moisture
  - Direct exposure to oxygen

## **Protection From Moisture**

#### • Dessicant packet inside pouch (e.g., Climara)

# **Protection From Moisture**

• Dessicant in secondary package (Patented by Noven in 2005 [6,905,016])

9 – moisture permeable pouches
15 – dessicant
16 – cover sheet
17 – reusable lid
18 – base sheet

#### • Everywhere (baked goods, fresh fruit, electronics)

# Protection From O<sub>2</sub> and Moisture

 Heat-sealed release liner (Patented by TheraTech in 1997 [5,662,925])

#### • Everywhere (food, household cleansers, cosmetics)

# Protection From O<sub>2</sub> and Moisture

Packaged in dry N<sub>2</sub>

Food, sporting goods

# What's the Message?

- We may think the pharmaceutical industry spends lots of money on innovation...
- But the consumer products industry spends much, much more and...
- They deal with many of the same challenges we do.

# It's Not Just Consumer Products

- Transportation
- Heavy industry
- Agriculture
- Arts and crafts

# How Do I Know?

- I read the journals.
- I talk to the scientists & engineers.
- And I remind myself that ideas and answers can come from anywhere, so...
- I also watch a lot of cable TV
